1 Kinetic evaluations for parent compounds

These examples are also evaluated in a parallel vignette of the **kinfit** package (Ranke, 2012).
The datasets are from Appendix 3, of the FOCUS kinetics report (FOCUS Work Group
on Degradation Kinetics, 2006, 2011).

1.1 Laboratory Data L1

The following code defines example dataset L1 from the FOCUS kinetics report, p. 284

```
R> library("mkin")
R> FOCUS_2006_L1 = data.frame(
+    t = rep(c(0, 1, 2, 3, 5, 7, 14, 21, 30), each = 2),
+    parent = c(88.3, 91.4, 85.6, 84.5, 78.9, 77.6,
+               72.0, 71.9, 50.3, 59.4, 47.0, 45.1,
+               27.7, 27.3, 10.0, 10.4, 2.9, 4.0))
R> FOCUS_2006_L1_mkin <- mkin_wide_to_long(FOCUS_2006_L1)
```

The next step is to set up the models used for the kinetic analysis. Note that the model
definitions contain the names of the observed variables in the data. In this case, there is
only one variable called `parent`.

```
R> SFO <- mkinmod(parent = list(type = "SFO"))
R> FOMC <- mkinmod(parent = list(type = "FOMC"))
R> DFOP <- mkinmod(parent = list(type = "DFOP"))
```

The three models cover the first assumption of simple first order (SFO), the case of declin-
ing rate constant over time (FOMC) and the case of two different phases of the kinetics
(DFOP). For a more detailed discussion of the models, please see the FOCUS kinetics
report.

The following two lines fit the model and produce the summary report of the model fit.
This covers the numerical analysis given in the FOCUS report.

```
R> m.L1.SFO <- mkinfit(SFO, FOCUS_2006_L1_mkin, quiet=TRUE)
R> summary(m.L1.SFO)

mkin version:    0.9.10
R version:       2.15.2
Date of fit:     Sat Feb 16 21:38:15 2013
Date of summary: Sat Feb 16 21:38:15 2013

Equations:
[1] d_parent = - k_parent_sink * parent

Starting values for optimised parameters:
                initial   type transformed
parent_0         100.0  state  100.000000
k_parent_sink      0.1 deparm   -2.302585

Fixed parameter values:
None

Optimised, transformed parameters:
               Estimate Std. Error
parent_0         92.471      1.368
k_parent_sink    -2.347      0.041

Backtransformed parameters:
               Estimate
parent_0         92.471
k_parent_sink     0.096

Residual standard error: 2.948 on 16 degrees of freedom

Chi2 error levels in percent:
           err.min n.optim df
All data     3.424       2  7
parent       3.424       2  7

Estimated disappearance times:
        DT50   DT90
parent 7.249  24.08

Estimated formation fractions:
              ff
parent_sink    1

Parameter correlation:
              parent_0 k_parent_sink
parent_0        1.0000        0.6248
k_parent_sink   0.6248        1.0000
```

```
Data:
 time variable observed predicted residual
    0   parent     88.3    92.471   -4.1710
    0   parent     91.4    92.471   -1.0710
    1   parent     85.6    84.039    1.5610
    1   parent     84.5    84.039    0.4610
    2   parent     78.9    76.376    2.5241
    2   parent     77.6    76.376    1.2241
    3   parent     72.0    69.412    2.5884
    3   parent     71.9    69.412    2.4884
    5   parent     50.3    57.330   -7.0301
    5   parent     59.4    57.330    2.0699
    7   parent     47.0    47.352   -0.3515
    7   parent     45.1    47.352   -2.2515
   14   parent     27.7    24.247    3.4527
   14   parent     27.3    24.247    3.0527
   21   parent     10.0    12.416   -2.4163
   21   parent     10.4    12.416   -2.0163
   30   parent      2.9     5.251   -2.3513
   30   parent      4.0     5.251   -1.2513
```
A plot of the fit is obtained with the plot function for mkinfit objects.

```
R> plot(m.L1.SFO)
```
The residual plot can be obtained using the information contained in the mkinfit object, which is in fact a derivative of an modFit object defined by the **FME** package.

```
R> plot(m.L1.SFO$data$time, m.L1.SFO$data$residual,
+   xlab = "Time", ylab = "Residual", ylim = c(-8, 8))
R> abline(h = 0, lty = 2)
```

For comparison, the FOMC model is fitted as well, and the χ^2 error level is checked.

```
R> m.L1.FOMC <- mkinfit(FOMC, FOCUS_2006_L1_mkin, quiet=TRUE)
R> s.m.L1.FOMC <- summary(m.L1.FOMC)
R> s.m.L1.FOMC$errmin

            err.min n.optim df
All data 0.03618911       3  6
parent   0.03618911       3  6
```

Due to the higher number of parameters, and the lower number of degrees of freedom of the fit, the χ^2 error level is actually higher for the FOMC model (3.6%) than for the SFO model (3.4%).

1.2 Laboratory Data L2

The following code defines example dataset L2 from the FOCUS kinetics report, p. 287

```
R> library("mkin")
R> FOCUS_2006_L2 = data.frame(
+   t = rep(c(0, 1, 3, 7, 14, 28), each = 2),
+   parent = c(96.1, 91.8, 41.4, 38.7,
+              19.3, 22.3, 4.6, 4.6,
+              2.6, 1.2, 0.3, 0.6))
R> FOCUS_2006_L2_mkin <- mkin_wide_to_long(FOCUS_2006_L2)
```

Again, the SFO model is fitted and a summary is obtained.

```
R> m.L2.SFO <- mkinfit(SFO, FOCUS_2006_L2_mkin, quiet=TRUE)
R> summary(m.L2.SFO)
```

```
mkin version:    0.9.10
R version:       2.15.2
Date of fit:     Sat Feb 16 21:38:15 2013
Date of summary: Sat Feb 16 21:38:15 2013

Equations:
[1] d_parent = - k_parent_sink * parent

Starting values for optimised parameters:
               initial   type transformed
parent_0         100.0  state  100.000000
k_parent_sink      0.1 deparm   -2.302585

Fixed parameter values:
None

Optimised, transformed parameters:
               Estimate Std. Error
parent_0         91.4656      3.807
k_parent_sink    -0.4112      0.107

Backtransformed parameters:
               Estimate
parent_0         91.466
k_parent_sink     0.663

Residual standard error: 5.51 on 10 degrees of freedom

Chi2 error levels in percent:
          err.min n.optim df
All data    14.38       2  4
```

```
parent      14.38       2  4

Estimated disappearance times:
        DT50  DT90
parent 1.046 3.474

Estimated formation fractions:
          ff
parent_sink  1

Parameter correlation:
           parent_0 k_parent_sink
parent_0        1.0000         0.4295
k_parent_sink   0.4295         1.0000

Data:
 time variable observed      predicted residual
    0   parent     96.1 91.4656079103   4.6344
    0   parent     91.8 91.4656079103   0.3344
    1   parent     41.4 47.1395280371  -5.7395
    1   parent     38.7 47.1395280371  -8.4395
    3   parent     19.3 12.5210295280   6.7790
    3   parent     22.3 12.5210295280   9.7790
    7   parent      4.6  0.8833842647   3.7166
    7   parent      4.6  0.8833842647   3.7166
   14   parent      2.6  0.0085318162   2.5915
   14   parent      1.2  0.0085318162   1.1915
   28   parent      0.3  0.0000007958   0.3000
   28   parent      0.6  0.0000007958   0.6000
```
The χ^2 error level of 14% suggests that the model does not fit very well. This is also obvious from the plots of the fit and the residuals.

```
R> plot(m.L2.SFO)
```

In the FOCUS kinetics report, it is stated that there is no apparent systematic error observed from the residual plot up to the measured DT90 (approximately at day 5), and there is an underestimation beyond that point.

```
R> plot(m.L2.SFO$data$time, m.L2.SFO$data$residual,
+    xlab = "Time", ylab = "Residual", ylim = c(-10, 10))
R> abline(h = 0, lty = 2)
```
We may add that it is difficult to judge the random nature of the residuals just from the three samplings at days 0, 1 and 3. Also, it is not clear why a consistent underestimation after the approximate DT90 should be irrelevant.

For comparison, the FOMC model is fitted as well, and the χ^2 error level is checked.

```
R> m.L2.FOMC <- mkinfit(FOMC, FOCUS_2006_L2_mkin, quiet=TRUE)
R> plot(m.L2.FOMC)
R> s.m.L2.FOMC <- summary(m.L2.FOMC)
R> s.m.L2.FOMC$errmin

          err.min n.optim df
All data 0.06204245       3  3
parent   0.06204245       3  3
```
The error level at which the χ^2 test passes is much lower in this case. Therefore, the FOMC model provides a better description of the data, as less experimental error has to be assumed in order to explain the data.

Fitting the four parameter DFOP model does not further reduce the χ^2 error level.

```
R> m.L2.DFOP <- mkinfit(DFOP, FOCUS_2006_L2_mkin, quiet=TRUE)
R> plot(m.L2.DFOP)
```

Here, the default starting parameters for the DFOP model obviously do not lead to a reasonable solution. Therefore the fit is repeated with different starting parameters.

```
R> m.L2.DFOP <- mkinfit(DFOP, FOCUS_2006_L2_mkin,
+   parms.ini = c(k1 = 1, k2 = 0.01, g = 0.8),
+   quiet=TRUE)
R> plot(m.L2.DFOP)
R> summary(m.L2.DFOP)

mkin version:    0.9.10
R version:       2.15.2
Date of fit:     Sat Feb 16 21:38:16 2013
Date of summary: Sat Feb 16 21:38:16 2013
```

11

```
Equations:
[1] d_parent = - ((k1 * g * exp(-k1 * time) + k2 * (1 - g) * exp(-k2 * time)) / (g * exp
```

Starting values for optimised parameters:
```
          initial    type transformed
parent_0    1e+02   state 100.0000000
k1          1e+00  deparm   0.0000000
k2          1e-02  deparm  -4.6051702
g           8e-01  deparm   0.9802581
```

Fixed parameter values:
None

Optimised, transformed parameters:
```
          Estimate Std. Error
parent_0   93.9500         NA
k1          4.9589         NA
k2         -1.0880         NA
g          -0.2821         NA
```

Backtransformed parameters:
```
          Estimate
parent_0   93.950
k1        142.434
k2          0.337
g           0.402
```

Residual standard error: 1.732 on 8 degrees of freedom

Chi2 error levels in percent:
```
          err.min n.optim df
All data    2.529       4  2
parent      2.529       4  2
```

Estimated disappearance times:
```
      DT50 DT90
parent   NA   NA
```

Estimated formation fractions:
```
[1] ff
<0 rows> (or 0-length row.names)
```

Data:
```
 time variable observed predicted residual
    0   parent   96.1 93.950000   2.1500
    0   parent   91.8 93.950000 -2.1500
    1   parent   41.4 40.143423   1.2566
    1   parent   38.7 40.143423 -1.4434
```

```
    3   parent      19.3 20.464500   -1.1645
    3   parent      22.3 20.464500    1.8355
    7   parent       4.6  5.318322   -0.7183
    7   parent       4.6  5.318322   -0.7183
   14   parent       2.6  0.503070    2.0969
   14   parent       1.2  0.503070    0.6969
   28   parent       0.3  0.004501    0.2955
   28   parent       0.6  0.004501    0.5955

R> s.m.L2.DFOP <- summary(m.L2.DFOP)
R> s.m.L2.DFOP$errmin

             err.min n.optim df
All data 0.02528763       4  2
parent   0.02528763       4  2
```
Therefore, the FOMC model is clearly the best-fit model based on the χ^2 error level criterion.

1.3 Laboratory Data L3

The following code defines example dataset L3 from the FOCUS kinetics report, p. 290

```
R> library("mkin")
R> FOCUS_2006_L3 = data.frame(
+   t = c(0, 3, 7, 14, 30, 60, 91, 120),
+   parent = c(97.8, 60, 51, 43, 35, 22, 15, 12))
```

```
R> FOCUS_2006_L3_mkin <- mkin_wide_to_long(FOCUS_2006_L3)
```

SFO model, summary and plot:

```
R> m.L3.SFO <- mkinfit(SFO, FOCUS_2006_L3_mkin, quiet=TRUE)
R> summary(m.L3.SFO)
```

```
mkin version:    0.9.10
R version:       2.15.2
Date of fit:     Sat Feb 16 21:38:16 2013
Date of summary: Sat Feb 16 21:38:16 2013

Equations:
[1] d_parent = - k_parent_sink * parent

Starting values for optimised parameters:
              initial   type transformed
parent_0        100.0  state  100.000000
k_parent_sink     0.1 deparm   -2.302585

Fixed parameter values:
None

Optimised, transformed parameters:
              Estimate Std. Error
parent_0        74.873      8.458
k_parent_sink   -3.678      0.326

Backtransformed parameters:
              Estimate
parent_0        74.873
k_parent_sink    0.025

Residual standard error: 12.91 on 6 degrees of freedom

Chi2 error levels in percent:
         err.min n.optim df
All data   21.24       2  6
parent     21.24       2  6

Estimated disappearance times:
        DT50  DT90
parent 27.43 91.12

Estimated formation fractions:
            ff
parent_sink  1

Parameter correlation:
              parent_0 k_parent_sink
```
```
parent_0        1.0000        0.5484
k_parent_sink   0.5484        1.0000

Data:
 time variable observed predicted  residual
    0   parent     97.8    74.873  22.92734
    3   parent     60.0    69.407  -9.40654
    7   parent     51.0    62.734 -11.73403
   14   parent     43.0    52.563  -9.56336
   30   parent     35.0    35.083  -0.08281
   60   parent     22.0    16.439   5.56137
   91   parent     15.0     7.510   7.48961
  120   parent     12.0     3.609   8.39083
```

R> plot(m.L3.SFO)

The χ^2 error level of 22% as well as the plot suggest that the model does not fit very well.

The FOMC model performs better:

```
R> m.L3.FOMC <- mkinfit(FOMC, FOCUS_2006_L3_mkin, quiet=TRUE)
R> plot(m.L3.FOMC)
R> s.m.L3.FOMC <- summary(m.L3.FOMC)
R> s.m.L3.FOMC$errmin

          err.min n.optim df
All data 0.07321867       3  5
parent   0.07321867       3  5

R> endpoints(m.L3.FOMC)
```
```
$distimes
           DT50      DT90
parent 7.729478 431.2428

$ff
logical(0)

$SFORB
logical(0)
```

The error level at which the χ^2 test passes is 7% in this case.

Fitting the four parameter DFOP model further reduces the χ^2 error level considerably:

```
R> m.L3.DFOP <- mkinfit(DFOP, FOCUS_2006_L3_mkin, quiet=TRUE)
R> plot(m.L3.DFOP)
R> s.m.L3.DFOP <- summary(m.L3.DFOP)
R> s.m.L3.DFOP$errmin
```

```
           err.min n.optim df
All data 0.02223992       4  4
parent   0.02223992       4  4
```

Therefore, the DFOP model is the best-fit model based on the χ^2 error level criterion for laboratory data L3.

1.4   Laboratory Data L4

The following code defines example dataset L4 from the FOCUS kinetics report, p. 293

```
R> library("mkin")
R> FOCUS_2006_L4 = data.frame(
+   t = c(0, 3, 7, 14, 30, 60, 91, 120),
+   parent = c(96.6, 96.3, 94.3, 88.8, 74.9, 59.9, 53.5, 49.0))
R> FOCUS_2006_L4_mkin <- mkin_wide_to_long(FOCUS_2006_L4)
```

SFO model, summary and plot:

```
R> m.L4.SFO <- mkinfit(SFO, FOCUS_2006_L4_mkin, quiet=TRUE)
R> summary(m.L4.SFO)
```

```
mkin version:    0.9.10
R version:       2.15.2
Date of fit:     Sat Feb 16 21:38:17 2013
Date of summary: Sat Feb 16 21:38:17 2013

Equations:
[1] d_parent = - k_parent_sink * parent

Starting values for optimised parameters:
              initial    type transformed
parent_0        100.0   state  100.000000
k_parent_sink     0.1  deparm   -2.302585

Fixed parameter values:
None

Optimised, transformed parameters:
            Estimate Std. Error
parent_0        96.44      1.949
k_parent_sink   -5.03      0.080

Backtransformed parameters:
            Estimate
parent_0      96.442
k_parent_sink  0.007

Residual standard error: 3.651 on 6 degrees of freedom

Chi2 error levels in percent:
        err.min n.optim df
All data   3.288       2  6
parent     3.288       2  6

Estimated disappearance times:
```

```
       DT50 DT90
parent  106  352

Estimated formation fractions:
            ff
parent_sink  1

Parameter correlation:
              parent_0 k_parent_sink
parent_0        1.0000        0.5865
k_parent_sink   0.5865        1.0000

Data:
 time  variable  observed predicted residual
    0    parent      96.6     96.44   0.1585
    3    parent      96.3     94.57   1.7324
    7    parent      94.3     92.13   2.1744
   14    parent      88.8     88.00   0.7972
   30    parent      74.9     79.26  -4.3589
   60    parent      59.9     65.14  -5.2376
   91    parent      53.5     53.18   0.3167
  120    parent      49.0     43.99   5.0054

R> plot(m.L4.SFO)
```
The χ^2 error level of 3.3% as well as the plot suggest that the model fits very well.

The FOMC model for comparison

```
R> m.L4.FOMC <- mkinfit(FOMC, FOCUS_2006_L4_mkin, quiet=TRUE)
R> plot(m.L4.FOMC)
R> s.m.L4.FOMC <- summary(m.L4.FOMC)
R> s.m.L4.FOMC$errmin

          err.min n.optim df
All data 0.02027643       3  5
parent   0.02027643       3  5
```

The error level at which the χ^2 test passes is slightly lower for the FOMC model. However, the difference appears negligible.
